

# Jeweler Competitor Battlecards: Project Report

Roll No: 20PD06

Name: ASHWIN KR

## Introduction

The **Jewellers Competitor Battlecards** project is designed to automate the process of collecting, analyzing, and presenting competitive intelligence data specifically within the jewelry industry. By leveraging various APIs and tools, this project creates detailed and actionable battlecards that provide insights into competitors' products, market trends, and strategic positioning. This tool is crucial for jewelry businesses aiming to stay ahead of their competition by understanding market dynamics and competitors' strategies.

## Tools Required

- ❖ **Python**: The primary programming language used for scripting and automation.
- ❖ **SpaCy**: A natural language processing (NLP) library used for extracting entities and analyzing text data.
- ❖ **Groq API**: Utilized for generating detailed and contextually accurate content for battlecards.
- ❖ **Streamlit**: A web application framework used to create an interactive user interface for data collection, analysis, and design.
- ❖ **JSON**: Data format for storing and exchanging data between different stages of the project.
- ❖ **FPDF**: A Python library for generating PDFs used for designing and formatting the final battlecards.
- ❖ **NewsAPI**: Used for collecting news articles related to competitors and industry trends, focused on jewelry.
- ❖ **ReportLab**: Used to generate more structured and premium PDF designs for the battlecards.

## Project Structure

*Jewellers\_competitor\_battlecards/*

— backend/	
— data_collection.py	# Script for collecting data from external sources (APIs, web scraping)
— data_analysis.py	# Script for analyzing collected data (extracting insights, processing raw data)
— battlecard_generation.py	# Script for generating the battlecard structure/content based on the analyzed data
— battlecard_design.py	# Script for designing and exporting battlecards into PDFs and text files using
— frontend/	
— app.py	# Streamlit-based app for managing user inputs and visual interface
— data/	
— api_keys.json	# API keys for external services (e.g., data collection)
— requirements.txt	# Python dependencies for the project
— README.md	# Documentation for setting up and running the project

## Methodology

### Data Collection:

- **API Integration:** Collect data from **NewsAPI** using competitor names and jewelry industry-related keywords.
- **Data Extraction:** Extract products and market trends from news articles using **SpaCy** for NLP.
- **Data Storage:** Save the collected and organized data into **JSON** files for further processing.

### Data Analysis:

- **Load Data:** Load collected and organized data from **JSON** files.
- **Profile Processing:** Analyze competitor profiles to extract product information and market trends.
- **Data Structuring:** Create structured profiles of competitors based on analyzed data and save them for battlecard generation.

### Battlecard Generation:

- **Content Generation:** Use **Groq API** to generate detailed and structured content for battlecards, including:
  - Competitor overview
  - Product details
  - Market trends and pricing
  - Strengths, weaknesses, and strategic insights

**Data Storage:** Save the generated battlecards in **JSON** format for subsequent design and download.

### Battlecard Design:

- **Design Templates:** Define multiple design templates (modern, classic, professional) for formatting the battlecards.
- **PDF and Text Creation:** Generate formatted **PDF** and text files for each battlecard based on the selected template using **ReportLab** for more structured and premium designs.
- **File Management:** Save and manage the designed battlecards for user download.

## User Interface:

- **Data Processing:** Provide an interactive **Streamlit** interface for users to input competitor names and jewelry-related keywords, triggering the data collection, analysis, and battlecard generation processes.
- **Design Customization:** Allow users to select design templates and download the customized battlecards.
- **Chatbot Integration:** A conversational bot integrated within the app to answer user queries about competitors based on the generated battlecards.

## Findings

- **Efficiency:** Automating data collection and content generation significantly reduces manual effort and time in generating competitor insights.
- **Customization:** **Groq API**'s advanced content generation capabilities enable detailed and contextually accurate battlecards.
- **Consistency:** The use of **SpaCy** and **Groq** ensures consistent and high-quality outputs across all generated battlecards.
- **User Interaction:** The **Streamlit** interface provides a user-friendly platform for managing the entire battlecard generation process, with additional chatbot capabilities enhancing the user experience.

## Recommendations

- **Enhanced Data Sources:** Consider integrating additional data sources or APIs to enrich the battlecard content with more diverse insights, especially focusing on jewelry-specific publications.
- **Template Expansion:** Introduce more design templates to offer users a wider range of customization options for battlecards.
- **Scalability:** Continuously evaluate and optimize the system to handle larger volumes of data and more competitors as the project scales.

## Challenges and Limitations

- **Data Quality:** Some news articles may contain incomplete or irrelevant information, which can affect the overall quality of the battlecards.
- **API Limitations:** Relying on external APIs like **NewsAPI** may introduce restrictions such as rate limits, affecting the volume of data that can be processed in a given time.

## Future Scope

- **Real-time Updates:** Implement real-time data feeds for continuous updates on competitors and market trends.
- **Advanced Analytics:** Integrate machine learning algorithms for deeper insights, such as sentiment analysis or predictive trends in the jewelry market.

## Conclusion

The **Jewellers Competitor Battlecards** project successfully automates competitive intelligence gathering within the jewelry industry. It provides businesses with a robust tool for gaining insights into market trends and competitor strategies. With its efficient data processing, customizable battlecard design, and user-friendly interface, this project offers a scalable solution for businesses seeking to enhance their competitive edge in the jewelry market.

## Sample Outputs

Deploy

- Chat with Battlecard Bot

## Jewellers Gen-Battlecard

Welcome to the Jewellers Battlecard Generator! This application helps you to:

1. **Collect Data:** Input jeweller names and industry keywords to gather relevant data.
2. **Analyze Data:** Process and analyze the collected data to derive insights.
3. **Generate Battlecards:** Create detailed battlecards based on the analysis.

### Instructions:

- **Enter Jewellers Names:** Provide a comma-separated list of Jewellers names. E.g., Tanishq, Malabar Gold and Diamonds.
- **Enter Industry Keywords:** Provide a comma-separated list of industry keywords relevant to your analysis.

Enter Jewellers names (comma-separated):

Tanishq, Malabar Gold and Diamonds, CaratLane, Kalyan Jewellers, Bhima Jewellers, Joyalukkas

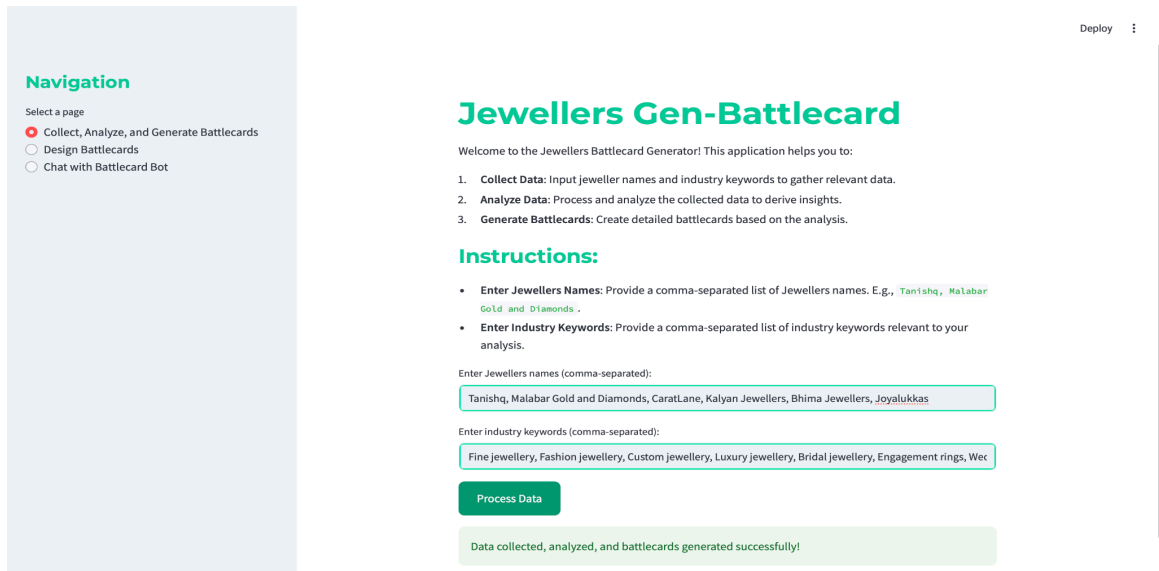

Enter industry keywords (comma-separated):

Vintage jewellery, Handcrafted jewellery, Contemporary jewellery, Minimalist jewellery, Statement jewellery

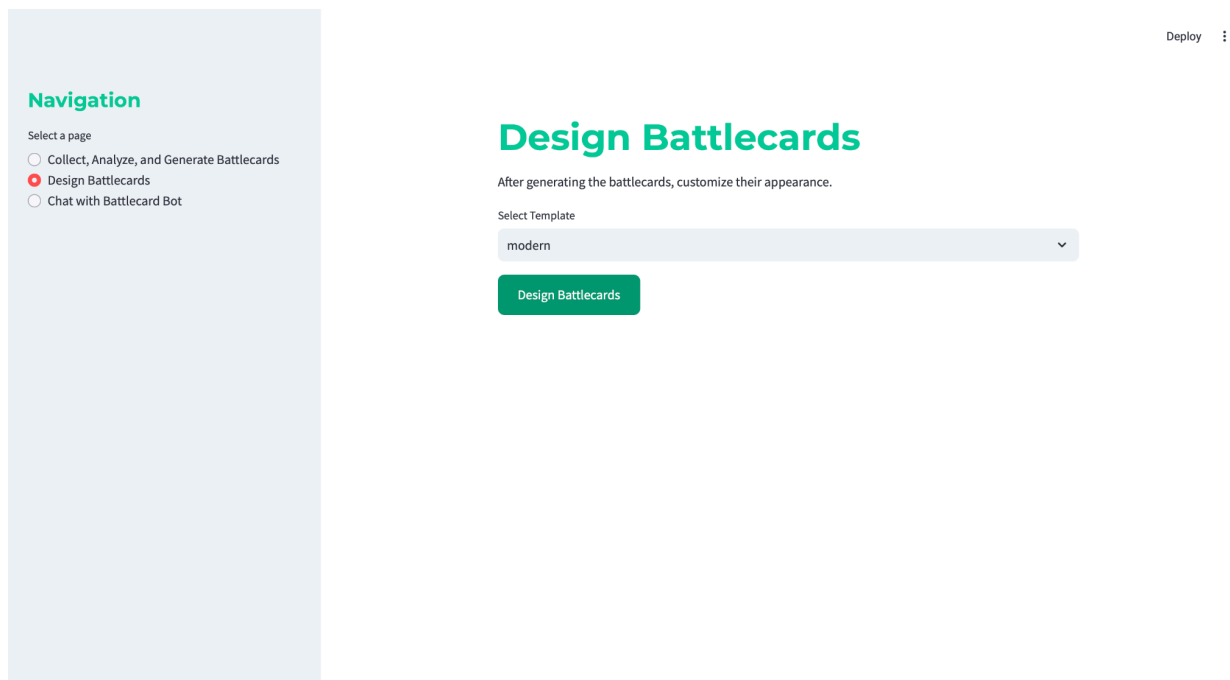

Press Enter to apply

Process Data

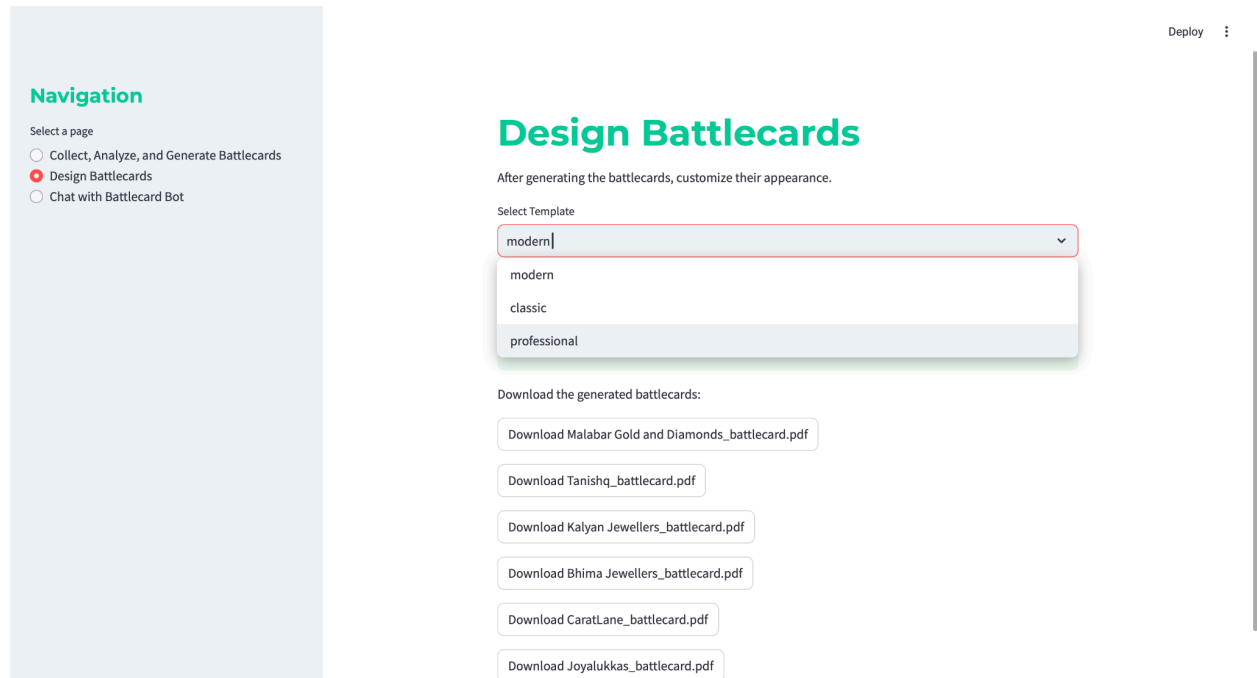

**Fig1** : The welcome page of the application to enter the competitor details

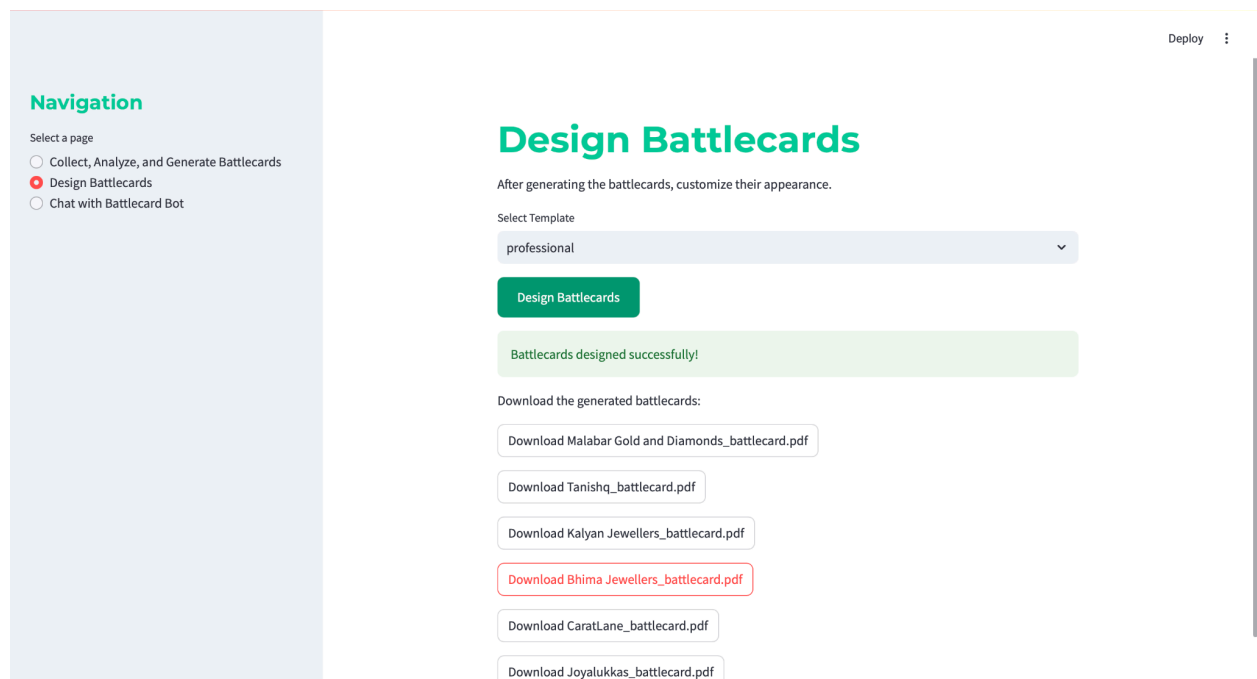

**Fig2 :** The data is collected, analyzed with the competitor details provided, battlecard information is generated

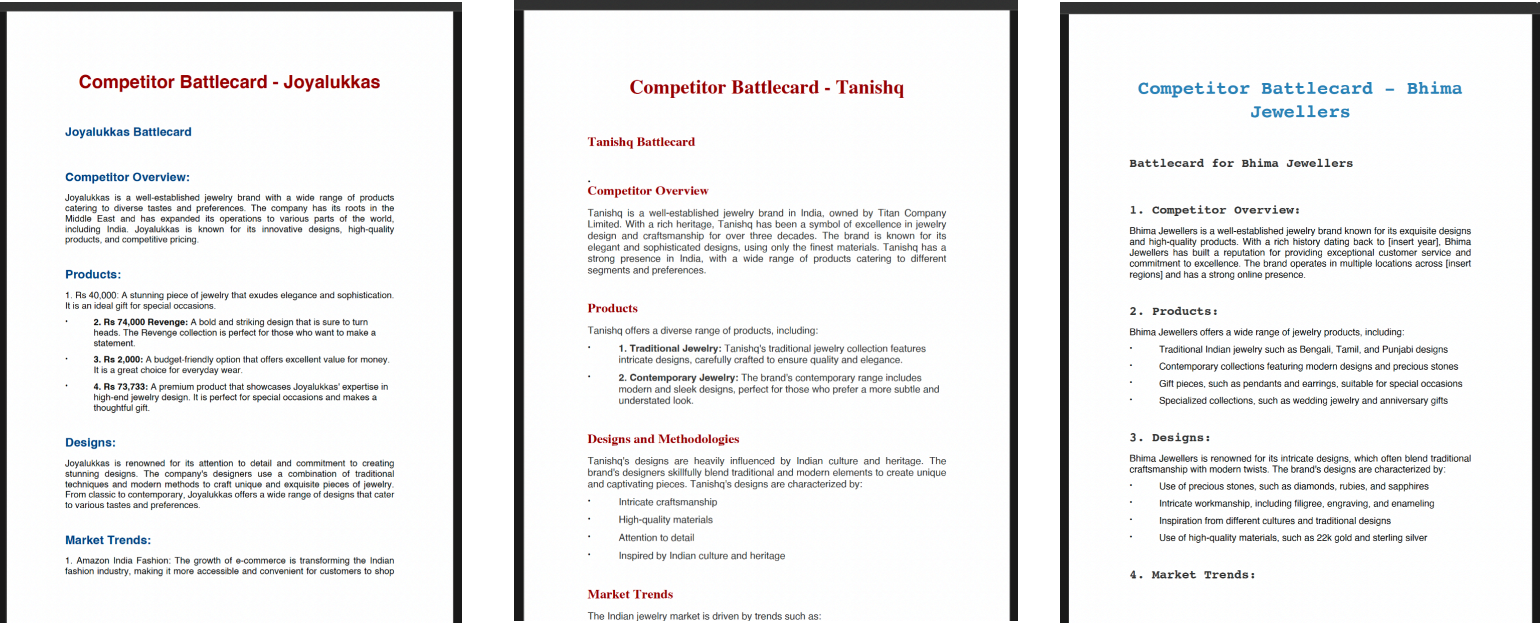

**Fig3 :** The web page to select the design for the battlecard as per the request of the user.

**Fig4 :** The user is asked to select the template for the battlecard and generate them.

**Fig5 :** The generated Battlecards of the competitors are available to download .
